

# WHO WE ARE

The GTA SOLUTION is a young and dynamic company that designs, manufactures and sells office machines for the trimming and bending of plotted projects and copies of great size.

The team of people who compose it has twenty years of work experience in the engineering industry where he actively participated in both the design phases of industrialization.

Taking part in the environment on a daily basis to the technical working life, we have realized the importance of properly stored in a small space and the projects on paper, so that they are then easy and convenient reference.

The old project management, made by rolling and placed inside "pipes", was no longer possible for both space for convenience and speed of consultation. Thus it was born the idea of building a simple and inexpensive manual machine for folding large sheets by reducing them to an A4 format (21 x 29.7 cm.) To facilitate archiving and consultation.

The car, so it was meant to be reliable and able to integrate the various technical departments, graphics and services. Then we will realize the need to support the folding machine a cutter machine to complete the job after the printing. To date, the feedback from our customers, the company is leading the design of electrified versions of cutters and binding machines.

Our mission is total customer satisfaction, a goal we set ourselves to achieve inexorably. To this end, we build machines that meet high quality standards, we have overcome many of reliability and that operate in safety tests. All supported by an emergency assistance service provided by the sales network.

## FLEXFOLD 1.1

To bend large sheets

With FlexFold 1.1 fold your projects will be quick and easy! Just unlock the folding machine with the appropriate knob and open the pressure bands, put the paper and use the handle to fold perfectly at 21 cm.

With FlexFold 1.1 you can fold A4 sheets of large format as plots in white paper, xerographic and heliographic copies, and within seconds your project is ready to be folded to 29,7 cm using the appropriate measurement drawer.

When folded A4 can store it in the shelf below, or add it in the classic filers envelopes. From now on, no more coiled projects confusion and waste of space! Optimize your time and space with FlexFold 1.1

- Bender FlexFold 1.1 manual is built entirely of steel and aluminum. Excellent performance and extreme compactness are its salient features. With a simple and practical movement allows to bend in A4 format (21 x 29.7 cm) plots, xerographic heliographic copies and large format and then categorize and store in a small space.
- Kinematic totally innovative handling and manufactured by precision machining of all components; for this purpose has been introduced a cam operation, suitably profiled, for maximum fluidity, progressiveness and absence of vibrations in the movements, all this by applying the least possible effort to handle the implementation.
- Structure of the rigid and non-deformable frame obtained by wide use of aluminum and steel mechanically worked to obtain precision couplings between the various elements. In addition an intermediate plate increases the stiffness of the frame, all to the advantage of the accuracy and repeatability of the bending of the sheet.
- Grippers deformable sectors such as to evenly distribute the load of the sheet clamping for the whole length of the machine working plane, it follows a bending of the sheet perfectly parallel on the sides without generating jaggies or quadrature errors on the edges. Furthermore they were introduced many technical devices to permanently eliminate any form of maintenance.
- Drawer with folding index at 29.7 cm. fully integrated in the machine body for better ergonomics of use and a lateral footprint of the machine reduced to a minimum.
- Basement with double wishbone structure for better stability during operation without allowing pesky lateral oscillations.
- Protected by patent in order to protect our customers from possible counterfeits or imitations.

## SILENT

Remarkably low noise in operation with the new technology SHOCK ABSORBER introducing specific braking elements on the powertrain. By these devices the measured noise level is 65 db and therefore totally in line with the valid legal regulations regarding acceptable noise pollution in the workplace, also making continuous use. With the Shock Absorber System we can affirm that he shot down the main limitation of the current manuals on the market machines.

On site [www.gtasolution.eu](http://www.gtasolution.eu) you can download the document with the detailed results of phonometric relief.

## COLOURS AND FINISHES

Custom color for the cover plates of the legs and mirror polishing of some details, all for seamless integration with your office. Available in gray, red, blue and yellow.

FLEXFOLD 1.1 to fold, catalog and consult your work!
